CODING PROJECTS:

CHIRPR

- Application built with idea similar to Twitter
- Created application using JavaScript, Bootstrap, Express, React, and MySQL
- Created UI that displays all messages in a timeline or a single message based on user
- User has the ability to create new messages that render to timeline upon submission
- Built an Express API router implementing HTTP CRUD operations
- Created MySQL database that stores user and message information

PERSONAL BLOG

- Created application for a personal blog
- Created Blog using JavaScript, SASS, Bootstrap, Express, React and MySQL
- Implemented authentication into blog to allow only users to be logged in to post, update, or delete information
- Implemented Salting and Hashing to secure user sensitive information

- Added third party API features (Mailgun and Stripe) to allow guests to email user and make any payment transactions
- Created MySQL database to store and track information for authors, blogs and security accessibility

STUDENT SUCCESS WEBAPP

- Worked on a team of three developers to develop, create and design an application for current students or recent graduates to allow the ability to create, maintain, and track information for career development
- Created project using TypeScript, Bootstrap, Express, React and MySQL
- Implemented security features to allow only individuals who are registered the ability to access information
- Used authentication to ensure user had correct credentials to access application
- Created a user dashboard to show daily and weekly stats to help user easily identify tasks that need to be and have been completed
- Created an events section to allow user to schedule and record various events such as Networking Activities, Interviews Scheduled, Application Submitted, Career Services Requests (current students) and Summary Forms to include any pertinent information
- Incorporated the use of an interactive calendar that shows the users events scheduled and displays the information in a easily readable format
- Created a MySQL database that stores all the information for all users and information submitted
- Used various queries and aggregate functions to retrieve data from database and render to the UI
- Linked all tables in database to ensure proper information was displayed to user
- Created API routes for all tables in database
- Used third party API's to display information from user GitHub account and render a quote of the day
- Deployed application using Heroku

PERSONAL WEBSITE

- Online resume and website created using React, JavaScript and CSS
